(54) Title: ATTACHMENT MEANS FOR A COSMETIC DISPENSER

(57) Abstract: An improved dispenser secures the cap (2) to the bottle(5), and especially to the housing, by a plurality of sets of mounting elements(10, 41), one (10) of which comprises a cam (12) providing axial movement of the cap (2) when it is rotated around the bottle (5) and the other (41) a follower (43), such a lug and bayonet. One element (41) is mounted on the interior of the cap (2) and the other (10) on the exterior of the bottle/housing (5). The mounting elements on the bottle/housing advantageously are separated both laterally around the periphery and axially so as to permit the mounting elements on the cap to pass axially between adjacent bottle elements and the cap to be rotated until matched sets of elements are brought into contact.
